ABSTRACT OF THE DISCLOSURE

A method and system for single form creation of a patient visit medical record via the Internet that integrates with the financial system of the healthcare provider. A patient record generally has medical data and financial data. This system improves processing medical data, patient care, and financial information. First, the system provides a digital visit form, hosted on a server, and completed at the user's location. Second, the digital form contains lists, boxes, and buttons for data entry and work flow. Third, the system joins the diagnosis and the plan of the medical record including codes for the visit CPT, the diagnosis, procedure, and labs, prescription, pharmacy, referred provider, notes and next appointment. This medical data then feeds into billing. Fourth, upon selecting the SAVE button, the system sends the medical and financial data to the server that updates the medical record, initiates medical and financial processes, and updates queues.
